#### 1.0 INTRODUCTION

#### 1.1. Purpose

This test plan supports the following objectives:

- To detail the activities required to prepare for and conduct the system test.
- To define the sources of the information used to prepare the plan.
- To define the test tools and environment needed to conduct the system test.
- To find and fix any flaws or problems in the system, before releasing the application to the end users.
- To prescribe the schedule of the testing activities.
- Communicate with all responsible parties involved, to provide an understanding of the testing process and objectives.

#### 1.2. Scope

The scope of testing covers white box and black box testing for features developed in Health2U from F001 to F0021. This test plan covers unit testing, integration testing, acceptance testing, and regression testing. This testing would focus on meeting the requirement of the system and making sure that the system fits the purpose.

Date: 02/05/2023 Test Plan ID: Health2U\_TP\_1.00

#### 2.0 TEST ITEMS

Health2U is a system that consists of both consultation and pharmacy services under one platform. This system includes several features such as user registration, managing profiles, purchasing medicines, consulting doctors, and so on. The user registration feature enables new users to create an account by providing their personal and contact information while existing users can log in to their accounts using their email address and password. The manage profile feature in Health2U enables registered users to manage their profiles where the users can edit their details.

The telemedicine subsystem allows patients to consult with doctors via video conferencing. This subsystem contains features that allow users to filter doctors, manage e-health records, manage e-prescriptions, make payments, manage appointments, and book appointments using chatbot and appointment notifications. Registered users are allowed to consult doctors via video conferencing. They are required to choose a valid payment card before proceeding with the consultation service to ensure the patient is charged the correct amount. The filter doctors feature enables users to find their desired doctors based on their category, gender, and language. The manage e-health records feature in the telemedicine subsystem allows the doctors to update the patient's health records within the platform. As well, doctors and patients can access the medical reports. The doctors can update the medical report and save it securely while the patients are only allowed to download the medical report. The manage e-prescription feature allows doctors to prescribe medication to patients through the platform. Besides that, the patients also can access the prescribed medication details and download them along with the medical report. In addition, patients can purchase the prescribed medications from the epharmacy subsystem in Health2U. The make payment feature allows the users to pay for the telemedicine service that is provided via debit or credit card payment method. Once the payment is done successfully, patients can download the generated payment receipt. The appointment management feature allows doctors to update and schedule appointments through the platform. This feature also allows the patients to manage their appointment, where they can view the appointments and cancel them via the platform. The booking of appointments via chatbot allows patients to book, reschedule, or cancel their appointments easily. The appointment notification feature in this system will enable the system to send emails to the

Date: 02/05/2023 Test Plan ID: Health2U\_TP\_1.00

patients and doctors when an appointment is booked, rescheduled, or canceled and also send a reminder email for both the patient and doctor before the appointment due date.

The e-Pharmacy subsystem allows customers to purchase healthcare products and medicines and the customer can collect them the product is ready for pickup. This subsystem includes features such as searching for products or medicines, filtering products, managing products in the cart, managing products and orders in real-time, performing payments, providing personalized product recommendations, and sending awareness messages to the users. The search feature allows customers to search for a specific product by entering the product name, whereas for medicines the customers have to enter the e-prescription id that was obtained from the Telemedicine system. The product filtration feature allows customers to filter products based on categories, such as supplements, medicines, baby care, and many more. It also allows customers to filter products based on subcategories, which can be specific health issues, product types, and product specifications to make it easier for users to find the products they need quickly and efficiently. This feature also enables customers to sort products based on their price. Besides that, the manage products in the cart feature allow customers, to view, add, modify, or delete product from the cart. This system also includes managing products and orders in real-time feature where any updates on the product or orders, will be instantly updated for all the users without any delays. Once the order status is updated to 'Ready to Pick Up', the system will instantly send a notification via SMS to the user to collect the product. Moreover, the perform payment feature allows customers to make payments using various payment methods such as PayPal, credit or debit card, and Cash On delivery, in order to complete their purchases. The product recommendation feature suggests products for customers that satisfy their interests by analyzing their purchase history. In addition, the system also includes sending awareness message features, where the admin can send messages to the customers via email, to create awareness of the fake and dangerous healthcare products.

|        | Add payment card: -                                | System, Unit, Integration |
| F032   | Patients are required to add a valid card into the |                           |
| F032   | system for payment transactions for                |                           |
|        | consultation.                                      |                           |
|        | Delete payment card: -                             | System, Unit, Integration |
| F033   | Patients can delete the card that is saved in the  |                           |
|        | system.  |                           |
| F034   | View payment card: -                               | System, Integration       |
| 1001   | Patients can view all their saved cards.           |                           |
|        | Select payment card: -                             | System, Integration       |
| F035   | Patients are able to select a valid card for       |                           |
|        | further processing of payment.                     |                           |
|        | Payment authorization: -                           | System, Integration       |
| F036   | The availability of fund in the card is checked    |                           |
| 1 050  | and the payment gateway accurately authorizes      |                           |
|        | payments and prevent declined transaction.         |                           |
|        | Payment confirmation: -                            | System, Unit              |
| F037   | The system should be able to confirm               |                           |
| 1 00 7 | successful payments and provide relevant           |                           |
|        | transactional details.                             |                           |
|        | View appointment details: -                        | System                    |
| F038   | Patients, doctors, and admin can be able to        |                           |
| 1030   | view all the appointments and details related to   |                           |
|        | the specific appointments.                         |                           |
|        | Filter appointments based on date, doctor,         | System, Unit              |
|        | and status: -                                      |                           |
| F039   | Patients and doctors can be able to filter their   |                           |
| 1007   | appointments based on different criteria such      |                           |
|        | as date and status whereas patients are able to    |                           |
|        | filter based on the doctor's name as well.         |                           |
|        |  |                           |

|       | View consultation details: -                     | System                    |
|-------|--|---------------------------|
| F040  | Doctors and patients are able to access and      |                           |
|       | view all the consultation details and the        |                           |
|       | specified consultation details.                  |                           |
|       | Filter consultation based on date and            | System, Unit              |
|       | doctor: -  |                           |
| F041  | Patients and doctors can be able to filter their |                           |
| 1041  | consultations based on date whereas patients     |                           |
|       | are able to filter based on the doctor's name as |                           |
|       | well.  |                           |
|       | Admin register doctor: -                         | System, Unit, Integration |
| F042  | Admin is able to register a doctor into the      |                           |
| FU42  | system and also send an email to the doctor to   |                           |
|       | update their email and temporary password.       |                           |
|       | Recommend healthcare products based on           | System, Unit, Integration |
|       | customer's interest: -                           |                           |
| F043  | The system should recommend healthcare           |                           |
| F 043 | products that customers might be interested in   |                           |
|       | by analyzing the purchase history of the         |                           |
|       | customer and other users.                        |                           |
|       | Search for a specific healthcare product: -      | System, Unit              |
|       | The customer should be able to search for a      |                           |
| F044  | specific healthcare product by typing            |                           |
|       | keywords related to it. Products that match the  |                           |
|       | keyword should be displayed on the screen.       |                           |
|       | Modify product information in real-time: -       | System, Unit              |
| F045  | The pharmacist can edit existing product         |                           |
|       | information. The edited information should be    |                           |
|       | updated for all users instantly.                 |                           |

|      | Display advertisement posters randomly          | System                    |
| EOOO | for each customer: -                            |                           |
| F080 | The system should display the posters           |                           |
|      | randomly for each customer.                     |                           |
| F081 | Admin manages user's details: -                 | System, Unit              |

|      | Admin can edit a user's basic details such as   |              |
|------|---|--------------|
|      | email, contact number, and address, and the     |              |
|      | data will be stored correctly.                  |              |
|      | Admin manages doctor's detail: -                | System, Unit |
| E002 | Admin can edit a doctor's basic details such    |              |
| F082 | as email, contact number, active status, and    |              |
|      | address, and the data will be stored correctly. |              |

Date: 02/05/2023 Test Plan ID: Health2U\_TP\_1.00

#### 4.0 FEATURES NOT TO BE TESTED

The following are the features that will not be tested: -

- i. Perform a payment using PayPal.
- ii. Credit card payment using Stripe.
- iii. Video call communication using VideoSDK API.
- iv. Sending reminders and notification emails using Gmail API

#### 5.0 TEST APPROACH OR TEST STRATEGY

#### 5.1 Test design techniques for white-box testing

Various actions will be taken to conduct the white box testing for the Health2u system. The internal structure and logic of the Health2u system can be evaluated comprehensively by carrying out white box testing strategies in the test plan of this system. This will ensure that the Health2u system will be dependable, and effective, and satisfies both its functional and non-functional needs.

The main white-box testing techniques that will be covered are: -

#### o Control-flow-based testing.

#### Statement testing

The design of statement testing will be by planning testing which involves testing each line of code or statement in the source code at least once. The coverage of the statement will be defined by identifying the total statements executed over the total number of statements. The test will be considered completed if the previously determined level of coverage is reached.

#### Path testing

Path testing will be conducted by developing test cases that ensure that all the paths in systems are passed through at least once.

Date: 02/05/2023 Test Plan ID: Health2U\_TP\_1.00

#### Decision testing

Design testing will be performed by developing test cases that will identify and test every possible outcome of a decision such as if/else statement, switch, for, and while statements. All potential outcomes of the decision points in the code are evaluated by using decision testing. This makes it easier to make sure the code runs properly in any case.

#### Condition testing

Condition testing will be performed by developing test cases that will test the identified conditions in the code. A condition is a logical expression, such as a comparison or a Boolean expression, that evaluates to true or false.

#### Dataflow-based testing.

Dataflow-based testing will be carried out by developing test cases that will test the identified data flows in the code. The transfer of data between variables, functions, or modules in the code is referred to as a data flow.

#### 5.2 Test design techniques for black-box testing

Black box testing will be performed for the system by developing test cases based on the system's requirements and specifications and executing them with various input values and conditions, to verify that the system behaves as expected and meets the desired quality standards. Black box testing aims to find flaws or issues that may impair the system's functionality, usability, or performance, from the enduser's perspective.

The main black-box testing techniques that will be covered are: -

#### Syntax testing

Syntax testing will be performed by defining test cases based on a formal input syntax specification to verify its accuracy and validity.

#### • Use Case Testing

Use case testing will be conducted by designing test cases that simulate scenarios from a use case, to detect integration defects that can arise from the interaction and interference of various system components.

#### • State Transition testing

State transition testing will be performed to verify that the system responds correctly to different input conditions and events, by testing the transitions between various system states.

#### • Decision Table testing

Decision table testing will be conducted to test different combinations of input conditions and their corresponding actions, to ensure that the system behaves as intended in all possible scenarios.

Date: 02/05/2023 Test Plan ID: Health2U\_TP\_1.00

## 7.0 ENTRY CRITERIA

The following items are needed before testing can begin:

- i. Software Requirement Document (SRD) of Health2U
- ii. Software under test: Health2u
- iii. Test data availability
- iv. Test environment readiness
- v. Test case availability

## 8.0 EXIT CRITERIA

The following items are needed before testing can end:

- i. Test execution has been completed.
- ii. Open defect at the end of the final iteration shall be:
  - Zero fatal defect
  - Zero major defect
  - <=minor defects
- iii. Documentation completeness: All the relevant documentation, such as user manuals, release notes, and installation guides, must be complete, accurate, and up to date.
- iv. User acceptance: The software must meet the expectations of the endusers and satisfy the business needs.
- v. Regulatory compliance: The software must comply with applicable regulations and standards, such as data protection laws or industry-specific regulations.
